

This project is focused on creating a golden set of tasks to train an LLM to generate custom user interface (UI) elements to improve models' overall output. As Expert Contributors on this project, you will be evaluating an LLM-generated conversation between a user and the Assistant and checking and editing the conversation so that it meets the requirements laid out in these guidelines.

Conversation Flow:

1. User Prompt
2. Grading Guidance/Rubric
3. (if applicable) Assistant makes tool call
4. (if applicable, and always when a tool generates a UI component) UI components
5. Assistant response

[insert flowchart]

For each section below, figure out which things the ECs actually have to check manually and what/how they'll fix it

Components and Tools:

- Info/content/properties in the custom UI components/elements should be **pulled from prior context within the conversation** (prompts, other responses, tool calls)
 - we don't want the model to hallucinate fake info
 - Exception for very minor/trivial and timeless knowledge from the model
- Components should not contain interactive elements (or even appear to be interactive at all)
 - So no dropdowns, buttons, filters, etc.
- Component properties should match the JSON in componentSchema

- UI elements should be present in the Assistant response only when they are relevant to the current turn, and should not appear before or after any turn they are necessary. ECs will need to ensure that any UI element given in a turn is relevant and helpful.
- Tool calls should appear before any UI components, and all things needed for UI components should be present in the tool calls.
- Tool calls need to respect their tools definition (new item in the output schema, next to componentSchema, as mentioned in a previous comment)
- Tools should have the same definition and arguments throughout the course of the conversation

Assistant responses:

- Must not include example or placeholder URLs/emails/data (example@mail.com, website.com)
- Should not claim that some element/data/feature is present in the response/UI elements when it is not; similarly, any claimed action should be based on a tool call directly preceding the Assistant response
 - E.g. “I’ve attached a PDF below ...”; “alerts via email are now set up” (without a tool call that actually does this)
- If a link is given, there should be a preceding web search to obtain the correct link
 - If the link is to a site whose URL could have changed in the past year, or is somewhat obscure and could benefit from a websearch, then we need the tool call, but basic/obvious websites can be pulled from training data
 - e.g. you wouldn’t need to call tool for [Spotify.com](https://www.spotify.com) but would need for unsubscribe link/link to instructions on how to unsubscribe
 - The LLM checker will flag when a link is provided but isn’t preceded by a tool call. ECs will have to check whether a web search tool call should have happened or not
- There should always be an Assistant message directly following a tool call – Users cannot see the tool messages, so we have to ensure that the User is always responding to the Assistant messages, and not the tools.

Grading Guidance/Rubric

- Needs to be specific to the *current turn* only, not future turns or the ultimate goal of the conversation
- Should it follow typical guidelines for other/most rubric-based projects? e.g. should the GG be self-contained, agreed on by experts, falsifiable, not stacked, etc.?
- Expected components section can be empty in a given turn if no UI elements are needed in that turn
 - ECs need to check this section because the LLM tends to always include something here
- Expected components should be in natural language and not in list form
 - Can mention 'nice to haves' vs. 'must haves' vs. 'could haves'

Questions to ask when you see a UI element in the output:

1. Is the UI element relevant and helpful to responding to the UP in the current turn?
 - a. If no, do x (e.g. get rid of UI element in the convo)
 - b. After this, ensure that it's gone from tool call
 - c. After this ensure that it's gone from the GG/expected components
2. Does the UI element appear or claim to be interactive?
 - a. If yes, do x
3. Is there a tool call preceding the UI element that corresponds to the UI element?
 - a. If no, do x
4. Does the UI element match the properties outlined in the tool call and the JSON of the componentSchema?
 - a. If no...
5. Is the information in the UI element not hallucinated? Is it pulled from context within the conversation?
 - a. If info is hallucinated or not pulled from within the context of the convo/tool call/etc., then...
6. Does the UI element shown appear in the Expected Components of the GG for the turn?
 - a. If no...
- 7.

Tools

GG

1. In the Expected Components section, is it written in natural language?
2. Are the given Expected Components relevant to the current turn?

Assistant response:

1. Does the Assistant repeat information that is already present in the UI components?
 - a. If yes...
2. If a tool was called, does the Assistant response include the UI components present in the tool call?
 - a. If no...
3. Does the Assistant refrain from saying that it is giving info or doing an action that it hasn't done (e.g. giving a pdf, sending an email, setting up push notifications)
 - a. If yes, edit Assistant response
 - b. If there was a direct ask from the User for something that the Assistant cannot provide, edit the User Prompt and Assistant response as necessary
 - i. e.g. drafting an email is fine, but not sending it
 - ii.
- 4.
